In September 2015 the UN will agree on a set of sustainable development goals (SDGs) and targets. Therefore, the international statistical community will be requested to develop a wide range of indicators, with an unprecedented level of details and timeliness. To obtain high quality data a lot of methodological and statistical policy issues need to be addressed. The presentation will discuss how to develop SDGs indicators benefitting from the ongoing data revolution, building on the work already carried out in the context of the "Beyond GDP" initiatives launched at national and international levels.

Keywords: sustainable development, data revolution, privacy, quality.
